

May Gardening Checklist

After digging out from a long, hard winter, we can finally start working in the garden and yard! The Utah State University Extension Gardener's Almanac provides a checklist for each month as well as links to tips and further information. Consider these gardening tips for May.

- Plant warm-season vegetables and annual flowers once the threat of the last frost has passed. See average first- and last-frost dates.
- Plant tomatoes deep enough that they are able to form more roots along the stem, thus creating a more vigorous plant.
- Consider planting sweet corn in the garden every other week (until early July) to extend the harvest.
- Learn about various fertilizers, including traditional fertilizer options, and organic fertilizers.
- Thin overcrowded seedlings using scissors. Try to avoid disturbing the young roots.
- Protect fruit blossoms and tender garden plants from

late freezing temperatures. Learn about critical temperatures for frost damage in fruit.

- Plant summer-blooming bulbs including gladiola, begonia, dahlia, and canna.
- Divide warm-season ornamental grasses when new growth begins to emerge.
- Learn to control landscape and garden weeds.
- Allow the foliage of spring blooming bulbs (tulips, daffodils, and crocus) to die down before removing the leaves.
- Renovate areas of your yard where there has been lawn damage.
- Learn about irrigation needs in your area.
- Aerate with a hollow core aerator in compacted sites when turfgrass is actively growing (April – June).
- Control broadleaf weeds in the lawn when temperatures are between 60-80 F. Follow the label and stop use of broadleaf herbicides once the temperature is above 85°F.
- Apply a slow-release lawn fertilizer to provide long-lasting results through the summer months.

Pests and Problems:

- Monitor newly planted vegetables for cutworm and flea beetle damage.
- Monitor for cankerworm damage on scrub oak and Box Elder trees along the foothills.
- Monitor for aphids on lush, new spring growth on plants. Treat for aphids by using “softer” solutions such as spraying them with a hard stream of water or by using an insecticidal soap.
- Monitor for slugs and snails. These pests thrive in moist, cool areas of the garden and landscape and feed on a variety of plant hosts.
- Protect ash trees from the lilac/ash borer around May first.

- Control codling moth in apples and pears to reduce wormy fruit. For specific timing, see our Utah Pests Advisories.
- Treat for powdery mildew on apples when leaves are emerging (at 1/2 inch green) until June.
- Watch for insect pests in raspberries from mid-May thru early June.
- Watch for cutworm damage in turfgrass and new vegetable starts.
- Monitor for damaging turfgrass insects. In areas previously damaged, consider a preventative (systemic) insecticide.
